

BEARD SNOODS

Beard Covers offer protection from facial hair contamination, ideal for use within the healthcare and food production / catering industries.

DTS Protect™ beard snoods (masks) are used to provide protection, hygiene, and safety, especially for individuals with facial hair. They are designed to cover the lower part of the face, including the beard and neck, while also offering certain benefits for those who need to wear respiratory protective equipment.

Healthcare and Medical Settings:

Healthcare workers with facial hair may use beard masks to ensure a proper seal when wearing respiratory protective equipment like N95 respirators or surgical masks. These masks help prevent the penetration of airborne particles and contaminants, ensuring the effectiveness of the respiratory protection.

Food Service and Hospitality:

Staff with facial hair who are involved in food preparation may use beard masks to prevent hair from falling into the food. This helps maintain hygiene and food safety standards.

Cleanrooms & laboratories:

Staff with facial hair who need to wear protective equipment may use beard masks or snoods to maintain a clean and contamination-free atmosphere.
