

OVERSHOES

Overshoes are used as protection against water, mud or dust. They are waterproof and used as a prevention of slips and electric shocks.

These overshoes are made from lightweight, non-woven materials and are designed to be worn over shoes or boots and are used in:

Healthcare and Medical Settings:

In hospitals, clinics, dental offices, and other healthcare facilities to prevent the spread of germs, contaminants, and potentially harmful substances from being tracked around the premises. They are commonly used in areas such as operating rooms, sterile environments, and isolation rooms.

Food Service and Hospitality:

In restaurants, food processing facilities, catering services, and other food-related businesses to prevent contaminants from outdoor footwear from entering food preparation areas. This helps maintain a clean and hygienic environment.

Cleanrooms & laboratories:

In industries such as pharmaceuticals, electronics manufacturing, and research laboratories to prevent the introduction of particles, dirt, and microbes that could compromise product quality or research outcomes.
