

EAR DEFENDERS

Ear defenders, also known as earmuffs or hearing protection earmuffs, are devices designed to protect the wearer's ears from excessive noise exposure. The ear cups contain sound-absorbing material and are designed to cover the ears entirely, forming a seal to block out or reduce the intensity of loud sounds.

DTS Protect™ are used in variety of sectors to prevent hearing damage and reduce the risk of noise-induced hearing loss: construction sites, industrial settings, airports, mining operations, music concerts and festivals.

DTS Protect™ ear defenders are padded with soft materials and have adjustable headbands to ensure a comfortable fit for extended wear. This is especially important for individuals who need to wear them for long periods.
